CMOS Technology:

Indispensible for our human society

Al the human activities are controlled by CMOS

living, production, financing, telecommunication, transportation, medical care, education, entertainment, etc.

Without CMOS:

There is no computer in banks, and

world economical activities immediately stop.

Cellarer phone dose not exists

Downsizing of the components has been the driving force for circuit evolution

1900	1950	1960	1970	2000
Vacuum Tube	Transistor	IC	LSI	ULSI
10 cm	cm	mm	10 μm	100 nm
10^{-1}m	10^{-2}m	10^{-3}m	10^{-5}m	10^{-7}m

In 100 years, the size reduced by one million times.
There have been many devices from stone age.
We have never experienced such a tremendous reduction of devices in human history.

Downsizing

1. **Reduce Capacitance**

→ **Reduce switching time of MOSFETs**

→ **Increase clock frequency**

→ **Increase circuit operation speed**

2. **Increase number of Transistors**

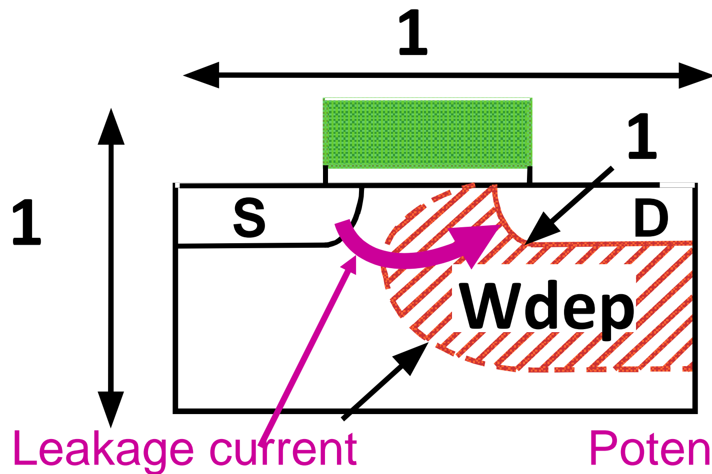
→ **Parallel processing**

→ **Increase circuit operation speed**

Downsizing contribute to the performance increase in double ways

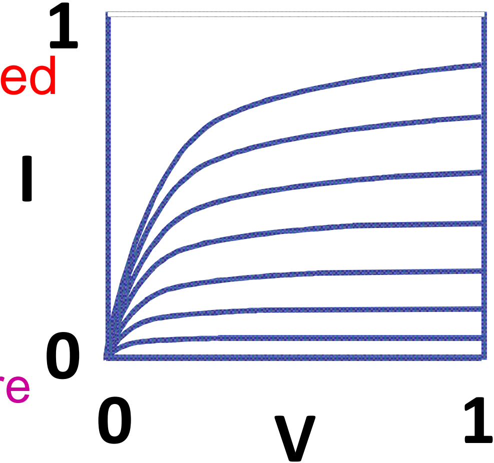
Thus, downsizing of Si devices is the most important and critical issue.

Scaling Method: by R. Dennard in 1974



Wdep: Space Charge Region (or Depletion Region) Width

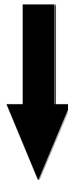
Wdep has to be suppressed
Otherwise, large leakage between S and D



Leakage current

Potential in space charge region is high, and thus, electrons in source are attracted to the space charge region.

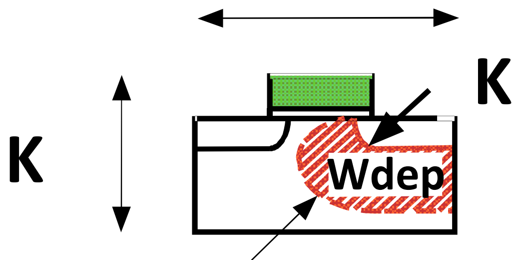
K=0.7 for example



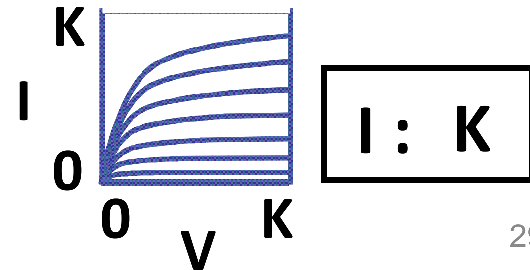
X , Y , Z : K, V : K, Na : 1/K

By the scaling, Wdep is suppressed in proportion, and thus, leakage can be suppressed.

→ Good scaled I-V characteristics



$$\text{Wdep} \propto \sqrt{V/Na}$$
: K



I : K

Downscaling merit: Beautiful!

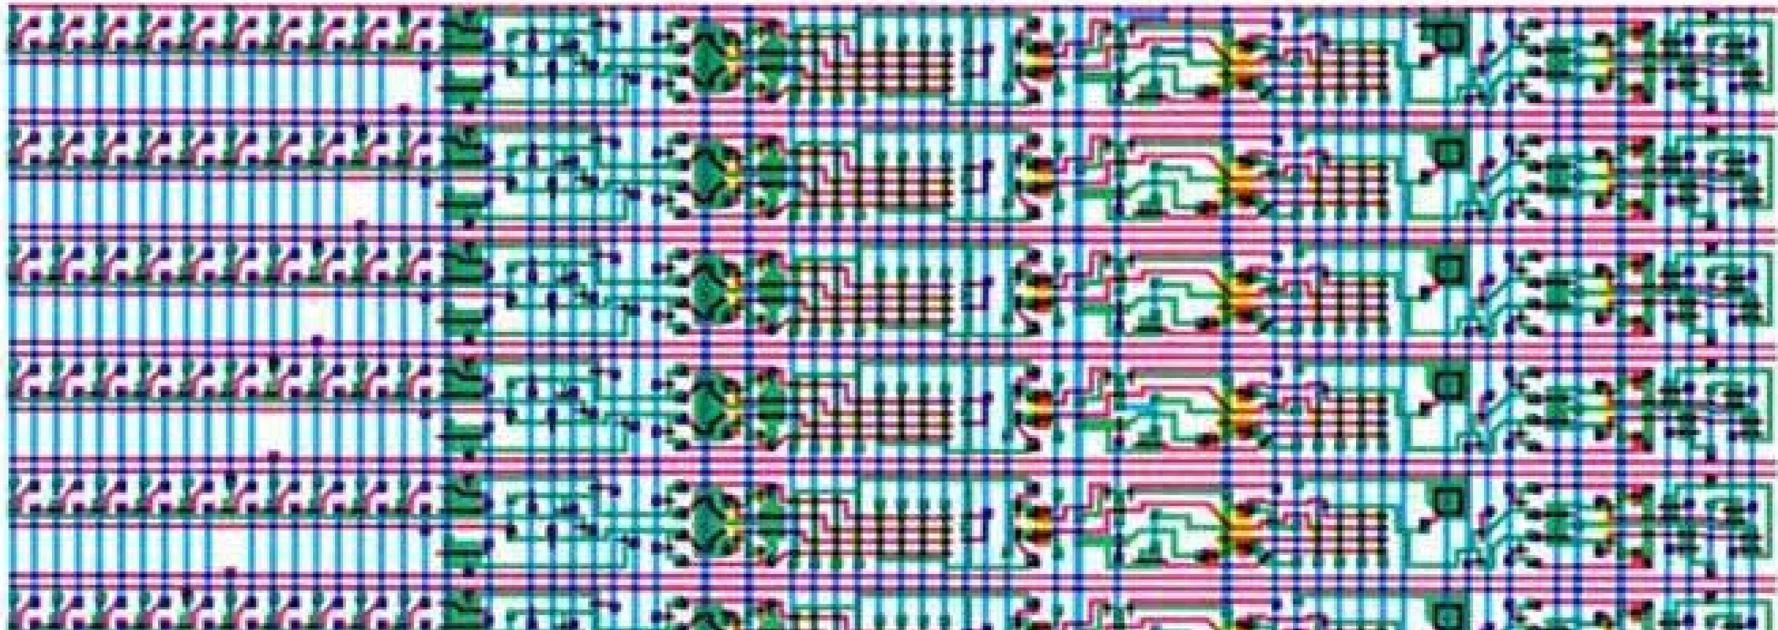
Many people wanted to say about the limit.
Past predictions were not correct!!

Period	Expected limit(size)	Cause
Late 1970's	1μm:	SCE
Early 1980's	0.5μm:	S/D resistance
Early 1980's	0.25μm:	Direct-tunneling of gate SiO_2
Late 1980's	0.1μm:	'0.1μm brick wall'(various)
2000	50nm:	'Red brick wall' (various)
2000	10nm:	Fundamental?

Historically, many predictions of the limit of downsizing.

VLSI text book written 1979 predict that 0.25 micro-meter would be the limit because of direct-tunneling current through the very thin-gate oxide.

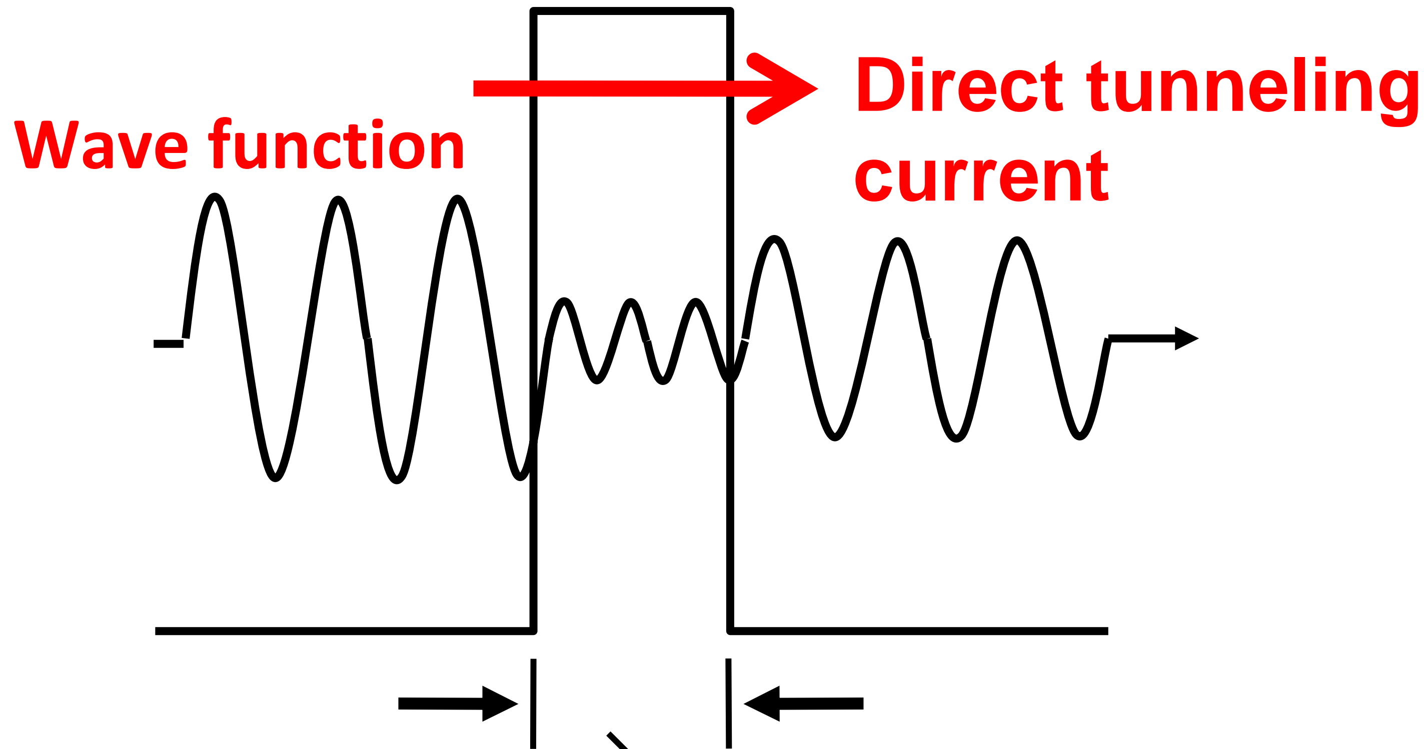


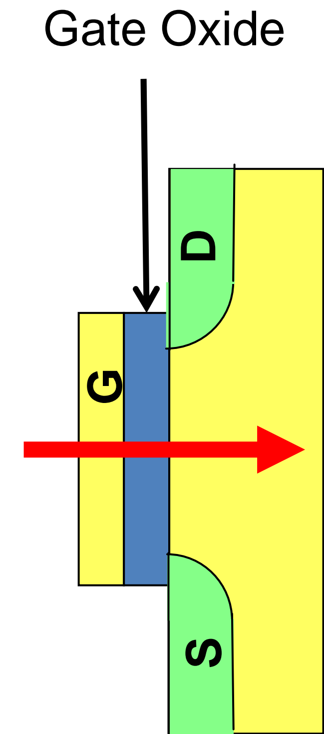
C. Mead L. Conway

VLSI textbook

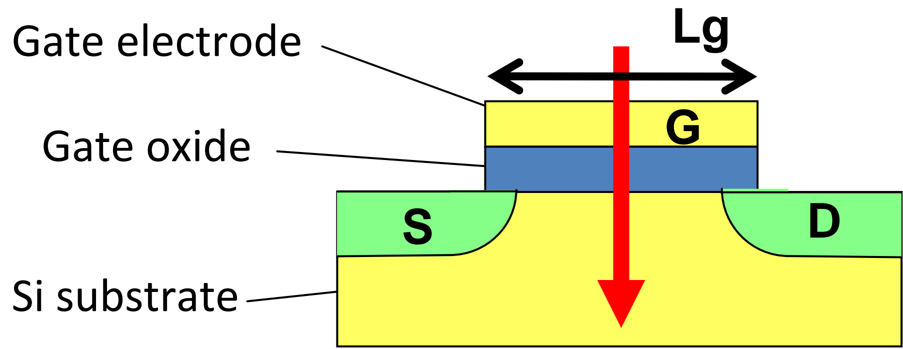
Finally, there appears to be a fundamental limit [10] of approximately quarter micron channel length, where certain physical effects such as the tunneling through the gate oxide ..... begin to make the devices of smaller dimension unworkable.

Direct-tunneling effect





Direct tunneling leakage current start to flow when the thickness is 3 nm.



Direct tunneling leakage was found to be OK! In 1994!

Question:

How far we can go with downscaling?

-There will be still 4~6 cycles (or technology generations) left until we reach 11 ~ 5.5 nm technologies, at which we will reach down-scaling limit, in some year between 2020-30 (H. Iwai, IWJT2008).

-Even After reaching the down-scaling limit, we could still continue R & D, seeking sufficiently higher Id-sat under low Vdd.

-Two candidates have emerged for R & D

1. Nanowire/tube MOSFETs
2. Alternative channel MOSFETs (III-V, Ge)

- Other Beyond CMOS devices are still in the cloud.

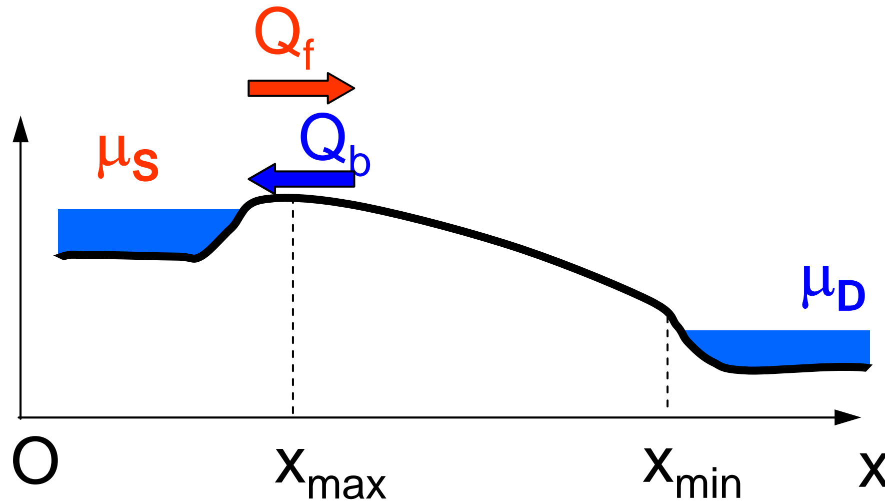
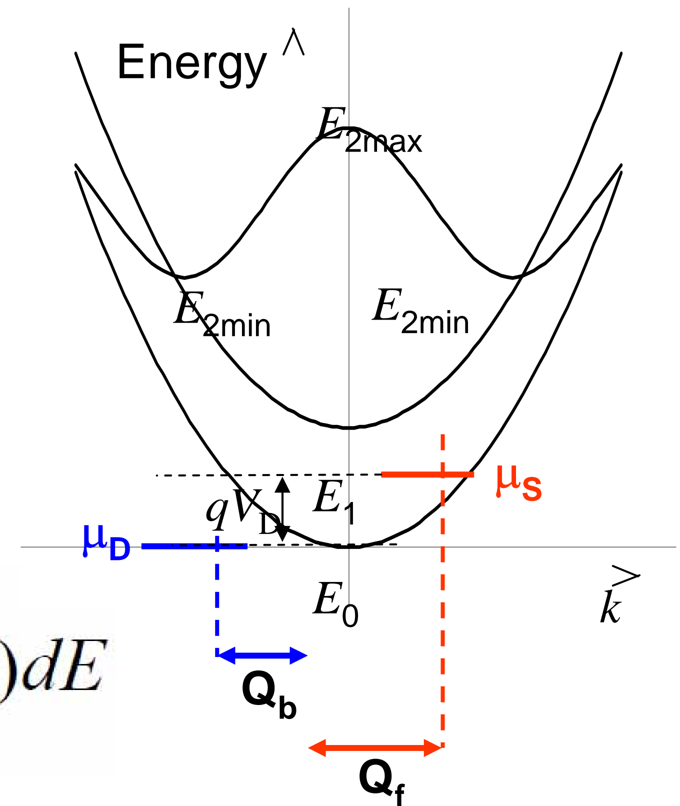
Landauer Formalism for Ballistic FET





$$I_D = \frac{q}{\pi\hbar}\sum_i \int [f(E,\mu_S) - f(E,\mu_D)] T_i(E)\,dE$$

From x_{max} to x_{min} $\quad T_i(E) \approx 1$

$$I_D = G_0\left(\frac{k_B T}{q}\right)\sum_i g_i \ln\left\{\frac{1+\exp[(\mu_S - E_{i0})/k_B T]}{1+\exp[(\mu_D - E_{i0})/k_B T]}\right\}$$

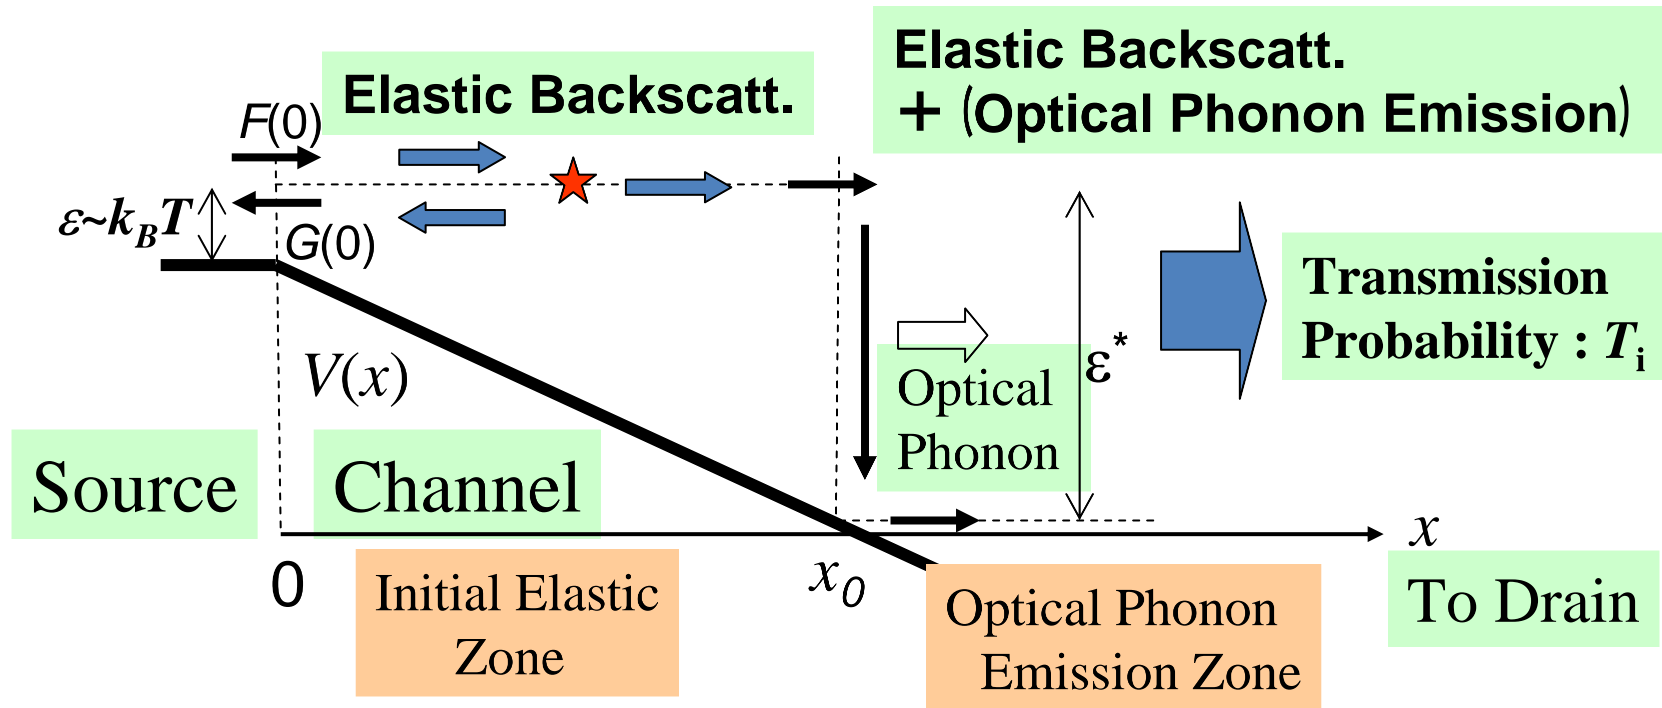
Model of Carrier Scattering

Linear Potential Approx. : Electric Field E



Transmission Probability to Drain

$$T(\varepsilon) = \left.\frac{F(0) - G(0)}{F(0)}\right)_{\text{Injection from Drain}=0}$$

Résumé of the Compact Model

$$I = \frac{q}{\pi\hbar}\sum_i g_i \int \left[f(\varepsilon,\mu_s) - f(\varepsilon,\mu_D) \right] T_i \, d\varepsilon$$

$$C_G = \frac{2\pi\varepsilon_{ox}}{\ln\left\{\frac{\sqrt{2r+t_{ox}}+\sqrt{t_{ox}}}{\sqrt{2r+t_{ox}}-\sqrt{t_{ox}}}\right\}}.$$

Planar Gate

$$(V_G - V_t) - \alpha\frac{\mu_S - \mu_0}{q} = \frac{\left|Q_f + Q_b\right|}{C_G}.$$

(Electrostatics requirement)

$$\mu_S - \mu_D = qV_D$$

$$C_G = \frac{2\pi\varepsilon_{ox}}{\ln\left(\frac{r+t_{ox}}{r}\right)}.$$

GAA

$$\left|Q_f + Q_b\right| = \frac{q}{\pi}\sum_i g_i \left[\int_{-\infty}^{\infty} \frac{dk}{1+\exp\left\{\frac{\varepsilon_i(k)-\mu_S}{k_B T}\right\}} - \int_{-\infty}^{0} \left\{ \frac{1}{1+\exp\left\{\frac{\varepsilon_i(k)-\mu_S}{k_B T}\right\}} - \frac{1}{1+\exp\left\{\frac{\varepsilon_i(k)-\mu_D}{k_B T}\right\}} \right\} T_i(\varepsilon_i(k))\,dk \right]$$

(Carrier distribution in Subbands)

$$T(\varepsilon) = \frac{\sqrt{2D_0}\,qE}{\left(\sqrt{B_0+D_0}+\sqrt{D_0}\right)qE + \sqrt{2mD_0}\,B_0\ln\left(\frac{qEx_0+\varepsilon}{\varepsilon}\right)}$$

Unknowns are I_D, $(\mu_S - \mu_0)$, $(\mu_D - \mu_0)$, $(Q_f + Q_b)$
